are spotted The antlers are occasionally very **simple ; in *C. rufus***
and a few allies (placed in a special sub-genus *Coassus)* they are
simple spikes without branches. In this genus, and in the nearly allied and also ^few-World *P-udua,* the vomer is prolonged back-
wards and divides the posterior nares into two. The bulk of the species are South American.

FIG. 154. — Chilian Doer. *Cccriacus*

Pudua, just mentioned, comes from the Chilian Ancles. It is
a small Deer without canines and with minute antlers. Other generic names have been proposed for various species of American
deer.

Hydropotes inermis is a small perfectly hornless Deer living
on the islands of the Yang-tse-kiang. The male has tusks; the
young are spotted. Though, like other deer, *Hydropotes* has no
both Mr. Garrod[1] and Mr. Forbes[2] found the rudi-
